

Kickstarting accessibility with design systems

1/ Welcome

Heather Battaglia

Engineering Supervisor, 18F
Denver, CO

Robert Jolly

Product Manager, 18F
Fort Collins, CO

**18F is a user-centered civic consultancy
for the U.S. government,
inside the U.S. government.**

We're federal employees.

2/ Design Systems

A design system is...

A series of reusable components

A way to create shared understanding between designers, developers, and content creators

A tool to help teams make the most of limited design support

A way to document decisions

A design system is *not*...

A replacement for UX
research and design

One person's opinions

A set of static laws

Branding

**Design systems
help you focus
on solving for
your users' needs.**

Legos, not clay

Design systems promote
“consistency over conformity”
(Aviva Oskow, 18F).

[Listen](#)

DESIGN PRINCIPLES

Design principles

USWDS Design Principles support and reflect the important guidance codified in the [21st Century Integrated Digital Experience Act](#). These design principles are intended to help teams across government align on important common goals and better use the design system — to be an evaluative lens for design and implementation decisions. Regardless of how you build, any USWDS project should support these principles.

Start with real user needs

Real user needs should inform product decisions. Whether our audience includes members of the public or government employees, decision-makers

**Do I need a design
system?**

(probably)

Design systems create common ground

- A common system for design and code
- Shared methodologies for user centered design
- Shared design principles
- Documentation of how we've done it and guides for doing it again

Form controls allow users to enter information into a page.

Note: If you are building a form with multiple controls, also consider the [accessibility guidelines in the “Form Templates” section](#).

General accessibility guidance for forms

Customize accessibly. As you customize these templates, make sure they meet the accessibility guidelines in this introduction and as described for each control.

Don’t control element order with CSS. Display form controls in the same order in HTML as they appear on screen. Don’t use CSS to rearrange the form controls. Screen readers narrate forms in the order they appear in the HTML.

Align validation with inputs. Visually align validation messages with the input fields, so people using screen magnifiers can read them quickly.

Use proper markup. Group each set of thematically related controls in a fieldset element. Use the legend element to offer a label within each one. The fieldset and legend elements make it easier for screen reader users to navigate the form.

Use legends. Use a single legend for fieldset (this is required). One example of a common use of fieldset and legend is a question with radio button options for

Pasted content. When users want to be able to paste in a response.

Accessibility

Customize accessibly. If you customize the text inputs, ensure they continue to meet the the [accessibility requirements that apply to all form controls](#).

Avoid placeholder text. Most browsers' default rendering of placeholder text does not provide a high enough contrast ratio.

Avoid splitting numbers. Avoid breaking numbers with distinct sections (such as phone numbers, Social Security Numbers, or credit card numbers) into separate input fields. For example, use one input for phone number, not three (one for area code, one for local code, and one for number). Each field needs to be labeled for a screen reader and the labels for fields broken into segments are often not meaningful.

Hey, there's a place

Guidance

When to use an address form

Guidance

When to use an address form

You need separate data elements. When you need to be able to parse out the specific parts of a mailing address.

When to consider something else

Nonstandard addresses. If you need to collect addresses that may not fit this format (for example, international addresses).

You don't need separate data elements. If you don't need to be able to parse out the individual pieces of an address, consider letting users type the entire address into one large text area.

Usability guidance

Don't call out required fields. Call out optional fields instead. Users can infer that non-optional fields are required.

Avoid dropdowns. If possible, let users type their state's abbreviation when they reach the state drop-down menu.

Support both five- and nine-digit ZIP codes. Some addresses require a nine-digit ZIP code. If you would like to use an input mask, it should be "#####-####" so that the text is properly formatted, regardless of

No guesswork!

Embrace accessibility

Accessibility affects everybody, build it into every decision. Legal requirements are a critical, necessary starting point, but this is only the beginning. Accessibility is about real people who use our services — it's usability for people who interact with products differently. Everyone who works on government websites has a role to play in making federal resources accessible and inclusive. Design generously and celebrate accessibility requirements as a set of design constraints that help us create a better product for all users.

Key considerations

- Can users navigate your site using only the keyboard?
- Can users use a screen reader to access the page content?
- Can users quickly understand the main points of your content?
- Can users easily interpret content associated with graphic elements?
- Can users easily understand and complete key tasks?
- Are you testing your service with a broad range of users?
- Do you know your agency accessibility team?
- Is your site organized such that everyone can navigate it easily?
- Are you using accessibility testing tools?
- Did your accessibility testing tools provide accurate results?
- Are you providing content in [languages other than English](#), as appropriate for the audience?

Embrace accessibility

Accessibility affects everybody, build it into every decision. Accessibility requirements are a critical, necessary starting point, but they're not the beginning. Accessibility is about real people who use our services differently. For people who interact with products differently. Everyone who uses government websites has a role to play in making federal services more accessible and inclusive. Design generously and celebrate accessibility. Acknowledge the set of design constraints that help us create a better product.

Accessibility Patterns Overview

Accessibility can seem complicated, but you can make accessible web apps with semantic markup and 18 principle patterns. These patterns form the basis of the Lightning Design System Components and are a companion to the accessibility documentation available on each component page.

What are Accessibility Patterns?

Accessibility patterns are the principle patterns a lot of the Lightning Components are built on. These patterns originate from traditional software applications and have been adapted to web applications in the [W3C's ARIA specifications](#).

The ARIA specifications follow patterns from traditional software applications because most assistive technology and power users are familiar with their interactions, layout, and naming conventions. So, to make your web based software feel familiar to your users, you should follow these conventions.

What makes these patterns accessible are additional HTML attributes and consistent keyboard interactions on top of semantic HTML markup. The attributes ARIA requires convey the pattern's identity, operation, relationship to other elements, and state to assistive technologies. This way, users know what is going on, what to do next, and how to do it.

United States Web Design System

Documentation Components Design tokens Utilities Page templates About

Page templates

The templates for a landing page and a documentation page are built from USWDS components. Each of these pages is flexible; you can add or remove components or subcomponents to suit your needs. These templates are great starting point for prototyping or for trying USWDS to see if it's a good fit for your project.

Landing page

Provide someone's first impression of your agency or program.

Often, site users arrive at a landing page without much context, like a search result or a colleague's email. So a landing page needs to be clear, engaging, and controlling.

The screenshot shows a landing page template with the following sections:

- Project title:** A header section with a search bar and a "Go" button.
- Hero callout:** A large section with a group photo and the text: "Here callout: Being attention to a project primary". Below the text is a "Learn more" button.
- A tagline highlights your approach:** A section with four circular icons and text boxes:
 - Simpler building our way:** "Simpler building our way..."
 - Work by to better results:** "Work by to better results..."
 - Simple highlight meeting goals:** "Simple highlight meeting goals..."
 - Good about it is:** "Good about it is..."
- Section heading:** A section with the heading "Section heading" and a paragraph of text. Below the text is a "Call to action" button.
- Component cards:** A row of five cards, each with a title, a description, and a "Learn more" button. The titles are: "Introduction", "Background", "Process", "Results", and "Next Steps".
- Footer:** A footer section with the text "Name of Agency" and "Agency Contact Center".

Below the screenshot, there is a link: [View landing page template](#).

Component cards

Usage

When to use the landing page template

Introducing a new program. If you are introducing a new program to the public through a marketing or publicity campaign, a landing page is a great place to point links at. It can build on the internal copy of a campaign without overwhelming readers.

When to avoid

Internal pages. Don't use a landing page for standard internal page content. The same things that help people understand basic quickly can become distracting for people who are looking for more depth.

- Landing page
- Documentation page

PAGE TEMPLATES

Page templates

These templates for a landing page and a documentation page are built from some of the components of the U.S. Forest Service Web Design Standards. Each of these pages is flexible; you can add or remove components or sub-components to suit your needs. These templates are great starting point for prototyping or for trying the Design System to see if they're a good fit for you.

Template 1: Landing page

A landing page is intended to provide someone's first impression of your agency or program. Often, they'll arrive from somewhere else without much context, like a search result or a colleague's email. So a landing page needs to be clear, engaging, and contextualizing.

Code

Documentation

When to use

- If you are introducing a new program to the public through a marketing or publicity campaign, a landing page is a good place to point links at. It can build on the minimal copy of a campaign without overwhelming readers.
- The landing page can be a good model for a homepage. But do some research first. What do you have to say? What do your users need to know? Figure these things out. It's important to know what you have to say about your organization before you settle on a homepage design.

When to avoid

- Don't use a landing page for standard internal page content. The same things that help people understand basics quickly can become distracting for people who are looking for more depth.
- Don't try to include forms or side navigation in a page like this. Those are visually complex components, and a landing page works best without too much complexity.

UI COMPONENTS

Colors

A flexible, yet distinctly US Forest Service palette designed to communicate warmth and trustworthiness while meeting the highest standards of 508 color contrast requirements.

Palette

This palette is designed to support a range of distinct visual styles that continue to feel connected. The intent of the palette is to convey a warm and open American spirit, with bright saturated tints of blue and red, grounded in sophisticated deeper shades of cool blues and grays. These colors — combined with clear hierarchy, good information design, and ample white space — should leave users feeling welcomed and in good hands.

This is a simple, minimalist color palette. Shades of blue dominate, providing a neutral backdrop on which brighter shades, clean type treatment, and bright white content areas “pop” on the page.

Primary colors

This palette’s primary colors are blue, gray, and white. Blue is commonly associated with trust, confidence, and sincerity; it is also used to represent calmness and responsibility.

#0072bc \$color-primary	#005493 \$color-primary-darker	#112e51 \$color-primary-darkest	#212121 \$color-base
#323645 \$color-gray-dark	#00b065 \$color-gray-light	#ffffff \$color-white	

Secondary colors

These are accent colors to provide additional lightness and style to pages looking for a more modern feel. These colors should be used to highlight important features on a page, such as buttons, or for visual style elements, such as illustrations. They should be used sparingly and never draw the eye to more than one piece of information at a time.

#02bfe7 \$color-primary-alt	#00a099 \$color-primary-alt-darkest	#00b062 \$color-primary-alt-dark	#00d0f1 \$color-primary-alt-light
#e17378 \$color-primary-alt-lightest			

IMPORTANT CAVEAT

**Don't start from
scratch**
(unless you need to)

(but really, don't)

This is the power of open source.

Design systems scale decisions

Make sure they're good decisions!

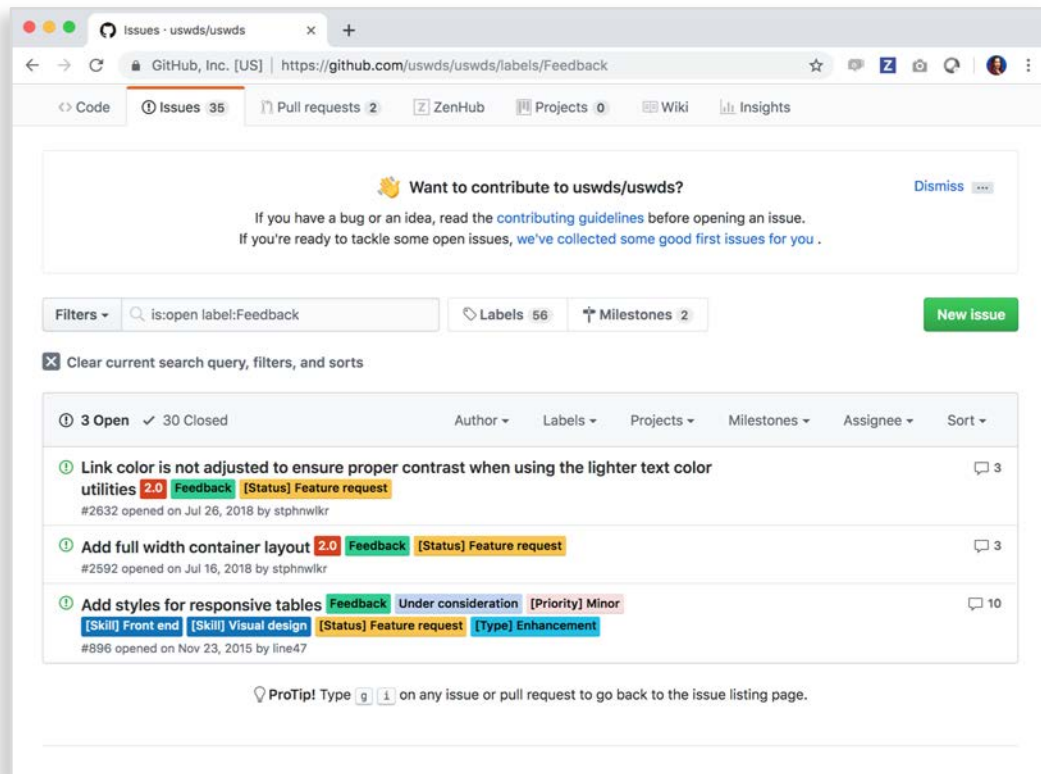

7/ Next Steps & Resources

Fork it

Open source enables collaboration

- Anyone can request a feature
- Anyone can create a suggested change and submit it for review
- Decision-making is documented
- We can learn from each other

A few open-source design systems

US Web Design System

Stanford's Decanter

IBM's Carbon Design System

Salesforce Lightning Design System
